

**A NEW ERA OF
COMMUNITY FINANCE**

TURAN

<http://turan.global>

We are a crypto-native community of developers, traders, analysts, and creators.

For 9+ years we have lived through every cycle — learning what works and what stands the test of time.

In Web3, the main advantage is neither the token nor the trend. It is the community that learns fast, acts together, and knows how to execute. That is why we build Turan: a community-governed ecosystem with education, research, and real tools — not promises. Reputation grants access and partner status through real contribution.

«Community is the new capital, and Turan is its architecture»

WHAT IS COMMUNITY FINANCING AND WHY IS IT NEEDED?

Community financing (ComFi) is a cooperative approach in which participants pool resources to support common initiatives and education.

Turan focuses on community development, research, and access to DeFi tools according to published rules.

Participation is voluntary. Reputation reflects contribution and helps shape partner status and access level.

Human capital matters. Reputation determines access and partner status based on measurable contribution — under transparent community rules.

WHAT IS COMMUNITY FINANCE (COMFI)?

Community finance (ComFi) is Turan's framework for education, coordination, and access to DeFi tools.

Our goal is to build a self-regulating community of independent participants who develop through education and real practice. Reputation reflects learning and contribution — onboarding, support, research, and ecosystem activity — and determines the access level, partner status, and privileges.

Governance is based on transparent rules and measurable participation. Digital assets are volatile and risky; participation is voluntary, results are not guaranteed.

TOKENOMICS

TRN is a utility token used within the Turan ecosystem. Deployed on the Base network (Ethereum L2), it supports low-cost transactions and access to product features and community tools. TRN is not a guarantee of returns.

- On-chain rules: TRN mechanics are enforced by smart contracts — transparent logic for fees, access levels, and reward conditions (where applicable on-chain).
- Real utility: TRN unlocks ecosystem features — reduced fees / level benefits, access to tools, partner privileges, and community governance (proposals + voting).
- Partner growth: status is earned through measurable contribution — onboarding, learning progress, support activity, and confirmed use of the ecosystem.
- Incentives and protection: time-limited campaigns, boosts, and rewards may be active under clear participation rules, with anti-abuse checks to reduce spam and bot-farming.

Risk disclaimer: crypto assets are volatile; the token price may change sharply. Participation is voluntary, results are not guaranteed.

Upon receiving TRN, the protocol automatically distributes the volume in accordance with the Tokenomics model.

The distribution is predefined and executed on-chain, depending on the chosen pool logic.

To interact with TRN, a Web3 wallet is used (MetaMask, Trust Wallet, and compatible solutions).

IN PARTNERSHIP

TURAN develops in cooperation with reliable infrastructure and protocol solutions of the Web3 ecosystem, which form the foundation of the platform's operation.

ROADMAP

The TURAN Tokenomics model is implemented in two phases.

Between phases, the platform expands progressively: products and tools are added that strengthen the ecosystem and community engagement.

1# 354H1 // PHASE #1
// PHASE #2

The Alpha Phase forms the economic foundation of the platform. At this stage, starting liquidity and initial token distribution are ensured, and on-chain strategies are implemented within the defined Tokenomics model. This phase establishes the operational structure for interaction and token circulation within the ecosystem.

The Beta Phase is aimed at scaling and transitioning to a fully autonomous model. Key factors are the ecosystem development dynamics, community activity, and achieved liquidity indicators. Within this phase, the deployment of autonomous smart contracts is completed and liquidity is transferred to a decentralized environment (DEX), excluding manual management.

TRN POOLS

The platform includes three TRN pools with different yield levels. Participants independently form their strategy, distributing funds between pools in any proportion or concentrating on one of them. Only TRN is accepted into all pools.

Income accrues only within the selected pools. Each placement is recorded on-chain and has a limited yield potential determined by volume and entry conditions.

200 POOL

Up to 200% APR

Conservative pool
Regular accruals

500 POOL

Up to 500% APR

High-risk pool
Quarterly accruals
Risk factor — 25%

1000 POOL

Up to 1000% APR

Aggressive pool
Semi-annual accruals
Risk factor — 50%

TRN PACKAGES

Packages determine how TRN operates within the TURAN protocol and how strongly participation influences income distribution in pools. The higher the active TRN volume, the greater the multiplier, which strengthens the participant's share in system results and amplifies the effect of the chosen strategy.

#1

10-999

1.5×

multiplier

#2

1,000-9,999

2×

multiplier

#3

10,000+

2.5×

multiplier

- Enhanced efficiency — stronger capital return within the protocol logic
- Diversification — simultaneous participation in multiple ecosystem directions
- Advanced mechanics — access to advanced tools and analytics

* Income is formed through pool activity and the partner program. Without an active pool, the partner component is not activated.

BUSINESS PACKAGE

The digital environment forms around trust and influence. Authors, experts, and community leaders become reference points in conditions of information overload. Business Package is intended for participants ready to share their own TURAN usage experience and who share the principles of Community Finance.

PACKAGE
COST

25 TRN

As part of a one-time offer, we invite you to become part of the leaders' community and share your own TURAN usage experience, demonstrating the simplicity and effectiveness of participation in the ecosystem. Rewards are credited through the TURAN reputation system.

UNILINE

The linear structure can be an effective team-building strategy. It assumes a model in which each participant attracts new partners, ensuring structure scaling and activity growth.

Unlocking new levels in the structure requires achieving the established token volume within the team and among directly invited partners.

Level	Direct partners	TRN volume in pools	Commission	Boost
1	-		7%	10%
2	3 partners	1,500	6%	8%
3	3 partners	4,000	5%	7%
4	5 partners	11,000	4%	5%
5	5 partners	30,000	3%	4%
6	7 partners	80,000	3%	3%
7	7 partners	215,000	2%	2%
8	9 partners	580,000	2%	2%
9	9 partners	1,600,000	2%	2%
10	11 partners	4,300,000	1%	1%
11	11 partners	11,500,000	1%	1%
12	13 partners	30,000,000	1%	1%

BOOST

Through activity within the ecosystem, the package coefficient can be increased from 1.5x to 4x. Coefficient growth is achieved through network expansion and engagement of direct partners.

The system implements a simple and transparent coefficient enhancement mechanism. To reach the maximum value, a 100% activity level is required. Each increase is immediately reflected in the current coefficient.

1.5x → 2x

2x → 3x

2.5x → 4x

With a package of 5,000 TRN and an activity level of 50%, the maximum coefficient will be 2.5x, which corresponds to 12,500 TRN.

- Applies to all active packages
- Only the activity of direct partners is taken into account
- Each increase is valid for 1 week
- Boost above 100% can accumulate
- With 100% activity for 31+ days, the uniline indicator is strengthened at levels 1–5

GLOBAL BINARY

Upon activation of each new pool, the participant receives a position in the global binary system. Positions are distributed among all participants and filled from left to right. The first two positions under the participant are automatically filled by the first two activations of personal partners or global participants — whichever occurs first. Starting from the third personal partner, filling continues within the global binary structure. If there are multiple active pools, personal partners first occupy the available positions below, then also move into the global binary.

After the pool closes, accruals on the binary structure for that pool cease. The closed position is considered completed and cannot be occupied again.

Create sustainable income by building a team and a long-term financial model. Free up time for family, travel, and life outside constant operational pressure.

Leverage the advantages of the decentralized ecosystem and become part of a community focused on results and scaling.
